

Discharge when outdoor power supply is charging

Overview

What happens if a battery is overcharged?

If the charging source can provide more current than the load requires, the excess current will be used to charge the battery. If the charging source cannot deliver enough current to supply the load, the battery will discharge, providing the extra current required.

What happens if a battery does not charge?

If the charging source cannot deliver enough current to supply the load, the battery will discharge, providing the extra current required. The battery will switch between charging and discharging automatically as the load demand and charge source capability vary.

How do you know if a battery is charging or discharging?

The direction of current through the battery determines whether it is charging or discharging. The battery is trying to push current in a particular direction. If the current flows in that direction, the battery is discharging. If the current flows in the other direction, the battery is charging. It is a little bit like a spring or a clockwork toy.

What determines if a battery charges or discharges?

Battery is like a capacitor which is like a spring. Voltage is like its force. What determines if it charges or discharges is voltage. There are several other contraptions between a battery and its outside that you can think of as friction inducing parts.

How do you know if a spring is charging or discharging?

When you have a spring, it tries to push in a particular direction (longer or shorter). If the spring moves in that direction, then it's discharging. If you push the spring in the opposite direction, it's charging.

What happens if a component has no power source?

If a component has no power source to gain from for about 10 minutes it will be drained of power. Depending on the capacity this varies, but I'm sure you will be fine. The ZAPPED query is because of static discharge built up on you and between the component, this is not relating to the power query you first mentioned.

Discharge when outdoor power supply is charging

5V 2A Type C USB Charging Discharge Board Bidirectional for ...

Type C features bidirectional charging and discharging: It can charge the through Type C, and also reverse to supply power to other devices. Strong compatibility: support standard USB C ...
