

Engineering emergency communication command base station

Overview

How do emergency command vehicles communicate after a disaster?

After a disaster, the emergency command vehicle arrives at the disaster site, and realizes data communication and relay communication with the rear emergency command center through satellite communication, ground fixed cable communication, and ground mobile communication networks.

What is an emergency communication system?

An emergency communication system comprises the integration and application of various communication technologies and approaches in an emergency.

What are two-way emergency communications systems?

The two-way emergency communications systems provide requirements for both wired and radio emergency services systems, area of refuge systems, and elevator communication systems. Chapter 24 includes a section that pertains to information, command, and control.

What is Emergency Management Communication?

It can be applied in fire protection, earthquake, and other fields to provide communication support for emergency rescue. According to communication scenarios and regions, emergency management communication mainly includes two layers: the 370M PDT digital cluster system and the field emergency communication system.

Which emergency communication system should be used at a disaster site?

The emergency network at the disaster site can be deployed by emergency communication vehicles; however, in the case of complex terrain environments, such as earthquakes and floods, satellite communication system is a better choice.

What are the requirements for emergency communication systems?

All emergency communications systems used to communicate emergency directions or messages should ensure the information provided meets the following general criteria: Must be real time — should not rely solely on pre-recorded messages, although they might provide limited value in some scenarios. Must be rich in content — actionable information.
