

# How to choose photovoltaic panel power

### **Overview**

Here's a step-by-step overview of the process we follow when sizing solar systems for our customers. Note: This article applies to grid-tie systems only. Off-grid systems are more complex because battery banks are sized independently of the solar array, so no two systems are quite the same.

Statistics showthat most people consume more electricity during the summer and winter, when the A/C or heat is running. If possible, collect your.

Next, divide your monthly kWh usage by 30 to estimate your average daily kWh usage. The average American home uses about 900 kWh per month, so we'll use that in our example: 900 kWh / 30 days = 30 kWh per day.

From there, we need to add a bit of overhead to account for inefficiencies and degradation rate of the panels. The output of solar panelsdrops slightly each year, which is outlined by.

Sunlight availability affects how much energy your solar panels generate. Use NREL's GHI maps to see how many sun hours you can expect to get in your location. Below is.

The most important factor when choosing solar panels is output and efficiency. Like the Vertex S DE09R.08 solar panel shown in the picture below, all solar panels have a power output denoted by a "W", or watts, and can exist as a range or a precise value.
