

The world s largest solar system

Overview

Jupiter is the largest planet in our solar system by size, mass, and volume. By size, Jupiter is gigantic, having a diameter of 142,800 kilometers or about 11 Earths across. In terms of volume, you could fit every other planet inside Jupiter, and there would still be space left over. Jupiter is more than 300 times the mass of.

Saturn is the second-largest planet in our solar system, with a diameter of 120,660 kilometers, or about 9.5 Earths across. By volume, you could fit 764 Earths inside Saturn. By mass.

Uranus is the third-largest planet in the solar system, with a diameter of 51,118 kilometers, or about four Earths across. Despite being only.

Earth is the fifth-largest planet in our solar system, with a diameter of 12,756 kilometers. The Earth is the largest and heaviest of the four inner rocky worlds. The Earth is also the densest planet in the solar system. Earth's high density comes from the fact that.

Neptune is the fourth-largest planet in the solar system, with a diameter of 49,528 kilometers, or about 3.8 Earths across. Interestingly, despite being smaller than Uranus, Neptune is.

Jupiter is the largest planet in our solar system, with a diameter of 89,000 miles. Jupiter image taken by the James Webb Space Telescope. Credit: NASA. Jupiter's average cloud-top temperature is -244°F (-153°C). Jupiter's escape velocity is 133,100 mph (214,200 km/h), significantly higher than Earth's.
