

# What inverter should I use for a 1MW photovoltaic system

### **Overview**

For a 1MW DIY solar system, string inverters can be a good option if the solar panels are installed in an area with minimal shading. They can be connected in parallel to handle the high power output of the system. How do I choose a solar inverter size?

To calculate the ideal inverter size for your solar PV system, you should consider the total wattage of your solar panels and the specific conditions of your installation site. The general rule is to ensure the inverter's maximum capacity closely matches or slightly exceeds the solar panel array's peak power output.

Do I need a solar inverter?

For most home and portable PV systems, you will only need one inverter if you are using either a string inverter or power optimizers for the solar array; if you use micro-inverters, you won't require a standalone inverter all as they convert DC to AC at the panel.

How much wattage should a solar inverter be?

You would need to purchase an inverter that matches the output of your solar array, so if you have a 6000W (6kW) system, your inverter would need to a rated at 6000W. You also need to consider the two different wattages involved here as there is a continuous and surge voltage.

How much solar power can a 5kw inverter produce?

Under the Clean Energy Council rules for accredited installers, the solar panel capacity can only exceed the inverter capacity by 33%. That means for a typical 5kW inverter you can go up to a maximum of 6.6kW of solar panel output within the rules.

What are the different types of solar inverters?

For instance, a microinverter system can increase energy output by up to 25%

in partially shaded areas. String inverters connect a series (or "string") of panels to a single inverter. These are the most common type used in residential and commercial solar systems.

How efficient is a solar inverter?

As long as the input from the panels falls within the range of the window, the inverter can be considered to be operating optimally. In the graph below, the red line represents an average inverter efficiency and the green arrow represents the power output from your solar panels.
